## TITAN LOCKCHAIN

Lockchain has been introduced to the market in 2019 and is as Marinpolyester a heavy and very strong material. The fact that the material doesn't need to be hemmed, makes it in theory superior over Marinepolyester. The lifespan of flags made of this material exceeds 7 months and this material is especially suitable for windy areas. As it does not have any holes like Polystretch, this material can be used for both horizontal as well as vertical flags.

Printed colors will hold well during the lifetime of these flags, but pollution, dust and sand can have a negative effect on the appearance. Washing will solve this issue.

NB! Be aware that strong winds can significantly reduce the lifespan of a flag, even to the extent that Supralon flags can rip within hours. Therefore we advise to take flags down when winds exceed 10,8 m/s.
